Eigen::internal::plog
< Packet4d >

Eigen::internal::plog
_double

```
graph LR; A[Eigen::internal::plog< Packet2d >] --> C[Eigen::internal::plog_double]; B[Eigen::internal::plog< Packet4d >] --> C;
```

The diagram illustrates the relationship between three Eigen internal logging functions. On the left, two boxes represent `Eigen::internal::plog< Packet2d >` (top) and `Eigen::internal::plog< Packet4d >` (bottom). On the right is a shaded box representing `Eigen::internal::plog_double`. Two blue arrows point from the left boxes to the right box, indicating that both `plog< Packet2d >` and `plog< Packet4d >` inherit from or specialize `plog_double`.
